Module 8 – Chapter 8 Exercise

The first company I found was “Codementor”. This is an online marketplace and consulting platform which offers support for Apache Web Server through their freelance experts. These experts help with debugging, setup, configuration, and performance issues. This is not a traditional consulting company. They connect you to freelance experts who help individuals and companies through paid sessions rather than full-time service. This is beneficial to those who only need quick help with certain issues or setups, rather than full-time service. They also assist with fixing errors or optimizing server performance. The company also provides screen sharing and live collaboration to help fix issues faster. The pricing is listed on their website, which typically goes for \$27 to \$35 for 15 minutes depending on the expert chosen for the task. The same expert can also be booked for longer if necessary.

The second company I found was “OpenLogic”. This is an IT support and consulting company. This company also provides professional support for Apache Web Server. They help businesses maintain their servers to fix any issues and keep servers running as intended. They offer different services such as troubleshooting IT issues and applying security updates. This company mainly helps medium or large businesses that need continuous support rather than occasional help. Their pricing is not clearly listed publicly and requires businesses to contact them for custom quotes based on the company’s needs.
